IMPORTANT

- DO NOT** test Winding resistance with the motor connected to the Control Box or Variable Frequency Drive (VFD).
- Test the windings by using a Multimeter or Ohmmeter to measure Ohms (Resistance) between Yellow or White to Red, Yellow or White to Black, and Red to Black.
- Resistance measured between any combination of wires should be a similar value.
- A bound pump will cause locked rotor amps and over-current fault/shut down. Check for obstructions in the pump and/or the amps on the Black wire at start-up.

CAUTION

Motor must be phased to ensure proper rotation

PHASING THE MOTOR

- 3 Phase motors are capable of running in both forward and reverse, so the pump can pump water both directions.
- If wired incorrectly, the pump will run in the reverse direction, pumping little water.

Continuously running the pump in reverse will cause premature motor failure that is not covered by warranty.

- When wired correctly, there will be a measurable increase in the amount of water pumped.
- Swapping any two red, yellow, or black wire connections will reverse the direction the motor is running.
- When in doubt, reverse any two red, yellow, or black wire connections and compare the water flow to determine the correct wiring configuration.
